

## Problem 10. «Public keys for e-coins»

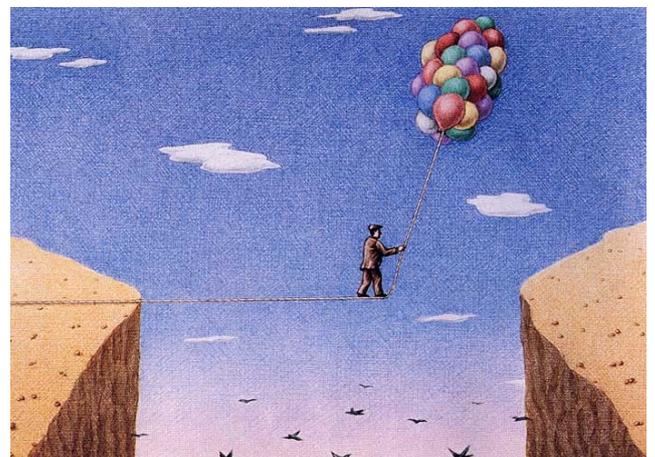

Alice has  $n$  electronic coins that she would like to spend via some public service  $S$  (bank). The service applies some asymmetric algorithm of encryption  $E(,)$  and decryption  $D(,)$  in its work. Namely, for the pair of public and private keys  $(PK, SK)$  and for any message  $m$  it holds: if  $c = E(m, PK)$ , then  $m = D(c, SK)$  and visa versa: if  $c' = E(m, SK)$ , then  $m = D(c', PK)$ .

To spend her money, Alice generates a sequence of public and private key pairs  $(PK_1, SK_1), \dots, (PK_n, SK_n)$  and sends the sequence of public keys  $PK_1, \dots, PK_n$  to the service  $S$ . By this she authorizes the service  $S$  to control her  $n$  coins.

If Alice would like to spend a coin with number  $i$  in the shop of Bob, she just gives the secret key  $SK_i$  to Bob and informs him about the number  $i$ . To get the coin with number  $i$ , Bob sends to the service  $S$  three parameters: number  $i$ , some non secret message  $m$ , and its electronic signature  $c' = E(m, SK_i)$ . The service  $S$  checks whether the signature  $c'$  corresponds to the message  $m$ , i.e. does it hold the equality  $m = D(c', PK_i)$ . If it is so, the service accepts the signature, gives the coin number  $i$  to Bob and marks it as «spent».

**Problem for a special prize!** Propose a *modification of this scheme* related to generation of public and private key pairs. Namely, is it possible for Alice not to send the sequence of public keys  $PK_1, \dots, PK_n$  to the service  $S$ , but send only some initial information enough for generating all necessary public keys on the service's side? Suppose that Alice sends to the service  $S$  only some initial key  $PK$  (denote it also as  $PK_0$ ), some function  $f$  and a set of parameters  $T$  such that  $PK_{i+1} = f(PK_i, T)$  for all  $i \geq 0$ . Propose your variant of this function  $f$  and the set  $T$ . Think also what asymmetric cryptosystem it is possible to use in such scheme.

**Requirements to the solution.** Knowing  $PK$ ,  $f$  and  $T$ , it is impossible to find any private key  $SK_i$ , where  $i = 1, \dots, n$ . It should be impossible to recover  $SK_i$  even if the secret keys  $SK_1, \dots, SK_{i-1}$  are also known, or even if all other secret keys are known (more strong condition).
